RELEASE HIGHLIGHTS

For Wallet Developers & Users: This release significantly upgrades wallet capabilities with the implementation of BIP 370 PSBTv2, enabling more flexible and complex transaction construction, alongside new RPCs for granular HD key control and improved descriptor handling.

For Node Runners: Performance and resource efficiency are boosted through parallel fetching of transaction prevouts during block validation, leading to faster initial block download, reduced disk space for the transaction index (``txindex``), and optimized UTXO cache management with a new ``dbcache`` setter.
